PROFILE

Backend Python Developer with **2.5 years of professional experience** building web applications and cloud services with **Python, FastAPI, Nuxt.js, and Google Cloud Platform**, complemented by production-grade personal projects: distributed systems with **gRPC**, database design and optimization with **PostgreSQL** and **Elasticsearch**, and scalable **API infrastructure** with **Redis** caching and background job processing. Experienced in containerized deployments with **Docker** and **CI/CD** automation.

WORK EXPERIENCE

07.2023 – 12.2025

Waber sp. z o.o. | Remote

Full Stack Web Developer

- Created and maintained cloud functions in GCP Cloud Run, optimizing response times through asynchronous processing.
- Optimized CRUD operations on Firebase Firestore, improving query performance with efficient data modeling and indexing.
- Developed and maintained responsive web applications using Vue.js and Nuxt.js for multiple client projects.
- Debugged and resolved performance bottlenecks across the full stack, reducing average page load time.

PERSONAL PROJECTS

ledger.jtuta.cloud · github.com/JakubTuta/Ledger-APP

Ledger is a **production logging system** I built using a **microservices architecture** with **Python** and **FastAPI**. It processes over **1,000 logs per second**, enabling teams to instantly detect application issues. I designed **gRPC**-communicating services with **PostgreSQL** for storage and **Redis** for caching, implemented a **REST API** for record querying and **SSE** for real-time error notifications, and published the official client library to **PyPI** (`ledger-sdk`). Applied horizontal scaling, async processing, and multi-layer caching. Containerized with **Docker**, deployed on **VPS**, tested with **pytest**.

minsik.jtuta.cloud · github.com/JakubTuta/Minsik-server

Minsik is a **book discovery app** built with a **microservices architecture** using **Python** and **FastAPI**. I designed the backend as **six gRPC microservices** behind a **REST gateway**, with **PostgreSQL** storage, **Elasticsearch** full-text search, and **Redis** for caching and background jobs. Features **JWT authentication**, continuous data ingestion from Open Library and Google Books APIs, and a 9-dimension book rating system. Built the **Nuxt.js** frontend with **SSR** and **SEO** optimization. Containerized with **Docker** and deployed on **VPS**.

EDUCATION

10.2021 – 02.2026

LODZ UNIVERSITY OF TECHNOLOGY

- Bachelor of Engineering — Computer Science (Specialization in Software Engineering)

SKILLS

- Python programming: Flask, FastAPI, Django
- Frontend: JavaScript, TypeScript, HTML, Vue.js, Nuxt.js, React
- API integration: REST, GraphQL, gRPC, WebSocket
- Version control: GitHub, GitLab
- Databases: MongoDB, Firestore, PostgreSQL, Redis, Elasticsearch
- Containerization: Docker, Kubernetes
- Cloud integration: Google Cloud Platform
- DevOps: GitHub Actions, GitLab CI/CD
- Monitoring: Sentry
- Testing: pytest
- Microservice architecture
- English (C1), Polish (native)
